Complete Medium:

Add solutions B through F to the sterile, cooled Solution A in the sequence given. Distribute anaerobically under 80% N₂, 20% CO₂. Final pH of the medium should be 7.1-7.4.

After the medium is dispensed, add ammonium oxalate (400 mM stock solution) to a final concentration of 30-40 mM. The addition of 10-20 mg of sodium dithionite per liter of medium (from 5% w/v solution, freshly prepared under N₂ and filter-sterilized) may stimulate initial growth.
