

ATCC® CELL LINES BY GENE MUTATION

ATCC®

THE ESSENTIALS OF
LIFE SCIENCE RESEARCH
GLOBALLY DELIVERED™

CELL CULTURE GUIDES

For over 85 years, ATCC has been a leader in preserving and culturing all types of biological materials. Over this time we have developed a vast body of tips and techniques to help researchers maximize the return on their biomaterial investment. The ATCC Culture guides deliver that information and insight to the end user in a portable, easy to follow format.

Download these useful guides to keep your cultures performing at their best, and your research moving forward.

Download now!

Cell Lines Organized by Specific Gene Mutation

Tumor cell lines become more powerful tools for cancer research and drug discovery when the genetic abnormalities that drive their phenotype are known. ATCC now offers our reliable, authenticated tumor cell lines annotated with gene mutation information from the Sanger Institute COSMIC database. This guide organizes our ATCC tumor cell lines according to gene of interest, and provides information for each line about the specific mutation, predicted protein sequence, zygosity, and tumor histology. We have collected this information together, so that you can quickly select the cell lines that best suit your research needs.

Table of Contents

APC	1
BRAF	3
CDKN2A	5
CTNNB1	10
EGFR	11
PIK3CA	12
PIK3R1	14
PTEN	15
RAS	18
RB1	22
SMAD4	25
TP53	27

Tissue-Specific Tumor Cell Panels

The value of tumor cell lines, as research models and drug discovery tools, is greatly enhanced when there is an understanding of the underlying genetic abnormalities that drive their phenotype. ATCC has taken the first step for your research by annotating our tumor cell lines with gene mutation data from the Sanger Institute COSMIC database, and additional in-house testing.

Download the ATCC Tumor Cell Panels brochure at www.atcc-guides.org/tcp

"The mutation data was obtained from the Sanger Institute Catalogue Of Somatic Mutations In Cancer web site, <http://www.sanger.ac.uk/genetics/CGP/cosmic/>. ATCC provides these data in good faith, but makes no warranty, express or implied, nor assumes any legal liability or responsibility for any purpose for which the data are used.

APC

Adenomatous polyposis coli (APC) is a tumor suppressor gene that plays a critical role in both cell division and adhesion, through the regulation of the Wnt-pathway protein, β -catenin. Mutations in the APC gene have been implicated in colon, lung and esophageal cancers, and they can lead to impaired β -catenin regulation, altered cell migration and chromosomal instability.

ATCC CELL CULTURE MEDIA

Cells are highly sensitive to their media environment, and may behave differently when their media is changed or when they are thawed into a media different from the one in which they were frozen. ATCC media will keep your cells behaving as expected. Our media is formulated with carefully adjusted buffers, glucose, vitamins and amino acids. The collection includes the “classic” media formulations, and media specially formulated to optimize growth of hybridoma, primary, or stem cells in culture. For more information go to www.atcc.org.

[†]For a description of the sequence variation nomenclature please refer to: *den Dunnen JT and Antonarakis SE (2000), Hum. Mutat. 15:7-12.*

BRAF

BRAF is a proto-oncogene encoding B-RAF, a serine/threonine kinase of the RAF family that acts downstream of RAS and upstream of MEK in the MAPK/ERK signaling pathway. B-RAF mediates cell division, proliferation and differentiation in response to a host of stimuli. Mutations in B-RAF lead to excessive cellular proliferation and enhanced survival, and often underlie birth defects, thyroid and skin cancer.

ATCC SERUM

Animal serum contains a variety of growth factors, cytokines, and proteins required for *in vitro* cell culture. When used at appropriate concentrations, serum supplies many of the defined and undefined components shown to satisfy the specific metabolic requirements of cultured cells. For more information go to www.atcc.org.

[†]For a description of the sequence variation nomenclature please refer to: *den Dunnen JT and Antonarakis SE (2000), Hum. Mutat. 15:7-12.*

CDKN2A

Cyclin-dependent kinase inhibitor 2A (CDKN2A) is a tumor suppressor gene, encoding three splice variants, two of which serve as inhibitors of the CDK4 kinase and are capable of inducing arrest at the G1 phase of the cell cycle.

CTNNB1

The catenin (cadherin-associated protein) beta 1 (CTNNB1) gene encodes the β -catenin protein. β -catenin is found in complexes that also contain cadherin cell adhesion molecules and are necessary for regulating cell growth and adhesion in epithelial cell layers. In addition, CTNNB1 can function as an oncogene and mutations of CTNNB1 are known to play a role in a variety of cancers.

EGFR

The epidermal growth factor receptor (EGFR) gene encodes for a single-pass trans-membrane tyrosine kinase that is a member of the ErbB family of receptors. These receptors are involved in the control of cell growth and differentiation. Upon activation, EGFR initiates multiple signal transduction cascades including the MAPK, AKT, and JNK pathways. Mutations in EGFR have been associated with numerous cancers, and it has become a direct target for the development of anticancer therapeutics.

ATCC CELL AUTHENTICATION TESTING SERVICE FOR STR PROFILE ANALYSIS

Short Tandem Repeat (STR) profiling, is a rapid, reproducible and standardized PCR-based method used to unambiguously identify or authenticate human cell lines at individual donor resolution. Given that misidentified cell lines continue to plague research, authentication of human cell lines via STR profile analysis is becoming a requirement of many journals and funding agencies.

Take advantage of our decades of experience with STR profiling and our unmatched expertise in interpreting data from over a thousand cancer cell lines. Send your human cell lines to the ATCC Cell Authentication Testing Service for STR profile analysis.

PIK3CA

The phosphatidylinositol-4, 5-bisphosphate 3-kinase, catalytic subunit alpha (PIK3CA) gene encodes the p110 α catalytic subunit of class I phosphatidylinositol 3-kinases (PI3K). PI3K operates as part of the PI3K/AKT/mTOR pathway to mediate cell proliferation, survival, migration and vesicular trafficking, and mutations in PIK3CA have been implicated in several cancers including those arising from colon, lung, ovary, and breast.

DISSOCIATION REAGENTS, ATCC[®] 30-2200™

Q: What can I do if my cells are difficult to remove from the plate after trypsin digestion?

A: There are several factors that can reduce the efficiency of the trypsin. For example, there may be inhibitors in the medium that are inactivating the dissociating enzyme. Make sure to rinse the cell monolayer thoroughly before adding the dissociating solution with a reagent, such as Dulbecco's Phosphate Buffered Saline (D-PBS), 1X (ATCC[®] 30-2200™).

PTEN

Phosphatase and tensin homolog (PTEN) is a tumor suppressor gene that encodes for a lipid phosphatase protein that down-regulates PI3K activity. The phosphatase activity of PTEN inhibits the AKT signaling pathway and affects regulation of the cell cycle. Mutations in this gene are associated with a variety of cancers, including prostate, brain, skin, and breast.

CULTURE MEDIUM

While most cell lines can replicate in more than one culture medium, their characteristics may alter when the medium is changed. For this reason, starting cell cultures in the same medium used by ATCC is recommended for the best results (see the Appendix for the medium recommendations for each of the cell lines listed in this brochure). For details on adapting a cell line to a new medium, see page 14 of the *ATCC Animal Cell Culture Guide*. To download guide go to www.atcc-guides.org/cellculture

[†]For a description of the sequence variation nomenclature please refer to: *den Dunnen JT and Antonarakis SE (2000), Hum. Mutat. 15:7-12.*

RAS

The Rat Sarcoma (RAS) proto-oncogene encodes for proteins (KRAS, HRAS, and NRAS) that belong to the small GTPase superfamily. RAS proteins recruit and activate downstream effectors, such as those of the AKT and ERK pathways that in turn affect cell growth, differentiation and survival. Mutations in the RAS gene have been identified in pancreatic, colon, thyroid, bladder and ovarian cancers, and may be predictive of a very poor response to some cancer drugs (e.g. those that inhibit EGFR).

GROWTH CURVES

Cells grow at different rates in each of the different phases of the growth cycle and the calculated doubling time may be a composite of growth during more than one of these phases. Growth during exponential growth or log phase is fairly constant and reproducible for a given set of growth conditions.

[†]For a description of the sequence variation nomenclature please refer to: *den Dunnen JT and Antonarakes SE (2000), Hum. Mutat. 15:7-12.*

RB1

The retinoblastoma (RB1) tumor suppressor gene encodes a protein that regulates cell proliferation by controlling progression through the G1 cell cycle checkpoint. RB1 has three unique binding domains and interacts with regulatory proteins including transcription factors and the c-Abl tyrosine kinase. Loss-of-function mutants of RB1 have been found in a host of cancers.

MTT CELL PROLIFERATION ASSAY, ATCC[®] 30-1010K™

Q: Can an MTT Cell Proliferation Assay directly replace [3H]-thymidine incorporation assays?

A: Yes, the addition of the dye solution can be substituted at the point in the assay when radioactive thymidine is added. Additionally, because the MTT Cell Proliferation Assay requires less cell manipulation than [3H]-thymidine the possibility of error is reduced and the standard deviation values are lower. In fact, comparisons between [3H]-thymidine incorporation and MTT assays have demonstrated less than 5% difference for determination of growth factor response.

SMAD4

The mothers against DPP homolog 4 (SMAD4) tumor suppressor gene is involved in cell differentiation, embryonic development and apoptosis. This gene encodes for a downstream effector of the TGF β signaling pathway, and is frequently inactivated in pancreas and colon cancers

UNIVERSAL MYCOPLASMA DETECTION KIT, ATCC[®] 30-1012K™

The Universal Mycoplasma Detection Kit offers a quick and sensitive PCR-based test to detect mycoplasma contaminants in cell culture. All components required for the PCR reaction are provided and have been optimized for amplification. High specificity is obtained through the utilization of a proprietary mix of buffers, dNTPs and thermostable polymerase, combined with universal primers that are specific to the 16S rRNA coding region in the mycoplasma genome. DNA originating from other sources, such as tissue samples or other bacteria, are not amplified. A touchdown PCR regimen increases sensitivity of the assay, along with enhancing specificity.

The kit detects over 60 species of Mycoplasma, Acholeplasma, Spiroplasma and Ureaplasma including the eight species most likely to afflict cell cultures: *M. arginini*, *M. fermentans*, *M. hominis*, *M. hyorhina*, *M. orale*, *M. pirum*, *M. salivarium*, and *A. laidlawii*. Samples that are positive for mycoplasma are easily recognized by a distinct PCR product ranging in size from 434 to 468 bp on an agarose gel. Find the Universal Mycoplasma Detection Kit product page at www.atcc.org.

TP53

The TP53 gene encodes a major tumor suppressor transcription factor, p53, which plays a significant role in regulating cellular responses to DNA damage and other genomic anomalies. p53 activation leads to cell cycle arrest and DNA repair upon damage and initiates apoptosis when DNA damage is irreparable. Activated p53 binds DNA and activates expression of a diverse set of genes. p53 is modified post-translationally at multiple sites and binds a host of proteins to regulate the specificity of its activity. Mutations or deletions in the TP53 gene are found in greater than 50 percent of human tumors.
