Description

Designation: TA/124

Deposited Name: *Thermoactinomyces antibioticus* Craveri et al.

Propagation

Medium

ATCC® Medium 293: Thermoactinopolyspora medium

Growth Conditions

Temperature: 45°C

Atmosphere: Aerobic

Propagation Procedure

1. Open vial according to enclosed instructions.
2. Using a single tube of #293 broth (5 to 6 ml), withdraw approximately 0.5 to 1.0 ml with a Pasteur or 1.0 ml pipette. Rehydrate the entire pellet.
3. Aseptically transfer this aliquot back into the broth tube. Mix well.
4. Use several drops of the suspension to inoculate a #260 agar slant and/or plate.
5. Incubate the tubes and plate at 45°C for 24-48 hours.

Notes

This item appears to grow best on #260 agar. The broth media #293 should be used for rehydration purposes only. This organism may also need a moist environment for optimal growth. Parafilm plates prior to incubation and incubate agar-side down to allow significant moisture within the culture.

On #260, colonies appear wrinkled, entire, and umbonate with white aerial mycelium.

1000X Photomicrograph

Description: 14570
