**Strain Designation:** IFP29 [CBS 7504, W29, CLIB 89]

**Deposited Name:** *Endomycopsis lipolytica* Wickerham et al.

**Product Description:** An ampoule containing viable cells (may include spores and mycelia) suspended in cryoprotectant.

---

**Propagation**

The information recommended in this section is to assist users in obtaining living culture(s) for their studies. The recommendation does not imply that the conditions or procedures provided below are optimum. Experienced researchers may initiate the growth of a culture in their own way.

- **ATCC® Medium 200:** YM agar or YM broth
- **ATCC® Medium 1245:** YEPD
- **ATCC® Medium 28:** Emmons' modification of Sabouraud's agar

**Growth Conditions**

- **Temperature:** 20°C to 25°C
- **Atmosphere:** Typical aerobic

**Recommended Procedure**

1. Open an ampoule according to enclosed instructions.
2. From a single test tube of sterile distilled water (5 to 6 mL), withdraw approximately 0.5 to 1.0 mL with a sterile pipette and apply directly to the pellet. Stir to form a suspension.
3. Aseptically transfer the suspension back into the test tube of sterile distilled water.
4. Let the test tube sit at room temperature (25°C) undisturbed for at least 2 hours; longer (e.g., overnight) rehydration might increase viability of some fungi.
5. Mix the suspension well. Use several drops (or make dilutions if desired) to inoculate recommended solid or liquid medium. Include a control that receives no inoculum.
6. Incubate the inoculum at the propagation conditions recommended.
7. Inspect for growth of the inoculum/strain regularly. The sign of viability is noticeable typically after 1-2 days of incubation. However, the time necessary for significant growth will vary from strain to strain.

**Colony and Cell Morphology:** After 5 days on YM media colonies butyrous to mycelial and tannish-white in color. Cells are spheroidal, ellipsoidal to elongate and single, in pairs or small clusters. Pseudohyphae and true hyphae are usually present.

**Notes**

Deposited as *Endomycopsis lipolytica* Wickerham et al.

Produces citric acid, citrate and isocitric acid.

Genome sequencing strain (Genolevures Consortium, France).

Additional, updated information on this product may be available on the ATCC® web site at www.atcc.org.

**DNA Sequence**

18S ribosomal RNA gene, partial sequence; internal transcribed spacer 1, 5.8S ribosomal RNA gene, and internal transcribed spacer 2; complete sequence; and 28S ribosomal RNA gene, partial sequence.

D1D2 region of the 28S ribosomal RNA gene.
Soil

Biosafety Level: 1

Appropriate safety procedures should always be used with this material. Laboratory safety is discussed in the current publication of the Biosafety in Microbiological and Biomedical Laboratories from the U.S. Department of Health and Human Services Centers for Disease Control and Prevention and National Institutes for Health.

ATCC Warranty

ATCC® products are warranted for 30 days from the date of shipment, and this warranty is valid only if the product is stored and handled according to the information included on this product information sheet. If the ATCC® product is a living cell or microorganism, ATCC lists the media formulation that has been found to be effective for this product. While other, unspecified media may also produce satisfactory results, a change in media or the absence of an additive from the ATCC recommended media may affect recovery, growth and/or function of this product. If an alternative medium formulation is used, the ATCC warranty for viability is no longer valid.

Disclaimers

This product is intended for laboratory research purposes only. It is not intended for use in humans.

Citation of Strain

If use of this culture results in a scientific publication, it should be cited in that manuscript in the following manner: Yarrowia lipolytica (ATCC® 20460™)
