

Product Sheet

Tannerella forsythia (ATCC® 700191™)

Please read this FIRST

Intended Use

This product is intended for research use only. It is not intended for any animal or human therapeutic or diagnostic use.

Citation of Strain

If use of this culture results in a scientific publication, it should be cited in that manuscript in the following manner: *Tannerella forsythia* (ATCC® 700191™)

Description

Designation: VPI N24A-08

Deposited Name: *Bacteroides forsythus* Tanner et al.

Propagation

Medium

ATCC® Medium 1921: NAM medium

Growth Conditions

Temperature: 37.0°C

Atmosphere: Anaerobic

Propagation Procedure

1. Open vial according to enclosed instructions.
2. Under anaerobic conditions, withdraw 0.5 ml of #1921 broth from a single test tube (5 to 6 ml) and rehydrate the entire vial contents.
3. Aseptically transfer this aliquot back into the broth tube. Inoculate #1921 agar slants with 2 ml of broth to create a biphasic culture. Inoculate pre-reduced agar blood plates (Medium #260) with 0.2 ml each of the cell suspension. Additional #1921 broth tubes may be inoculated with 0.5 ml each. An aerobic agar blood plate may also be streaked to check for purity.
4. Incubate tubes and plates under anaerobic conditions at 37°C. Incubate agar blood plate aerobically at 37°C.
5. When initially opened growth may take up to two weeks. Once growth has been established growth should be evident by off-white growth on the bottom of the slant and granular sediment in broth tubes within 4 to 6 days. No growth should occur on the blood agar plate incubated aerobically.

Anaerobic conditions for transfer may be obtained by either of the following:

- Use of an anaerobic gas chamber;
- Placement of test tubes under a gassing cannula system connected to anaerobic gas.

Anaerobic conditions for incubation may be obtained by any of the following:

- Loosen screw-caps on test tubes in anaerobic chamber;
- Loosen screw-caps on test tubes in an activated anaerobic gas pack jar,
- Use of sterile butyl rubber stoppers on test tubes so that an anaerobic gas headspace is retained.

Notes

Colonies on #1921 agar plates are small, entire, glistening, circular, smooth, dull white, and low convex. This strain grows best in broth culture or a biphasic culture. NAM is required for growth. Always use freshly prepared pre-reduced media or pre-reduced media that has been previously prepared but stored under anaerobic conditions.

Additional information on this culture is available on the ATCC® web site at www.atcc.org.

Biosafety Level: 2

Appropriate safety procedures should always be used with this material. Laboratory safety is discussed in the current publication of the *Biosafety in Microbiological and Biomedical Laboratories* from the U.S. Department of Health and Human Services Centers for Disease Control and Prevention and National Institutes for Health.

ATCC Warranty

ATCC® products are warranted for 30 days from the date of shipment, and this warranty is valid only if the product is stored and handled according to the information included on this product information sheet. If the ATCC® product is a living cell or microorganism, ATCC lists the media formulation that has been found to be effective for this product. While other, unspecified media may also produce satisfactory results, a change in media or the absence of an additive from the ATCC recommended media may affect recovery, growth and/or function of this product. If an alternative medium formulation is used, the ATCC warranty for viability is no longer valid.
