### Description

**Organism:** Homo sapiens, human  
**Tissue:** colon  
**Disease:** normal  
**Cell Type:** Epithelial  
**Age:** 13 weeks gestation  
**Morphology:** epithelial  
**Growth Properties:** adherent

**DNA Profile:**
- Amelogenin: X,Y  
- CSF1PO: 11,12  
- D13S317: 12,13  
- D16S539: 9,11  
- D5S818: 12,13  
- D7S820: 8,12  
- TH01: 6,9,3  
- TPOX: 8,11  
- vWA: 16

### Intended Use

This product is intended for research use only. It is not intended for any animal or human therapeutic or diagnostic use.

### Complete Growth Medium

The base medium for this cell line is DMEM:F12 Medium (ATCC 30-2006). To make the complete growth medium, add the following components to the base medium:
- extra 10 mM HEPES (for a final conc. of 25 mM)  
- 10 ng/ml cholera toxin  
- 0.005 mg/ml insulin  
- 0.005 mg/ml transferrin  
- 100 ng/ml hydrocortisone  
- 20 ng/ml human recombinant EGF (Thermo Fisher PHG0311)  
- Fetal Bovine Serum, 10% final conc (ATCC 30-2007)

### Citation of Strain

If use of this culture results in a scientific publication, it should be cited in that manuscript in the following manner: FHC (ATCC® CRL-1831™)

### Batch-Specific Information

Refer to the Certificate of Analysis for batch-specific test results.

#### SAFETY PRECAUTION

ATCC highly recommends that protective gloves and clothing always be used and a full face mask always be worn when handling frozen vials. It is important to note that some vials leak when submerged in liquid nitrogen and will slowly fill with liquid nitrogen. Upon thawing, the conversion of the liquid nitrogen back to its gas phase may result in the vessel exploding or blowing off its cap with dangerous force creating flying debris.

### Unpacking & Storage Instructions

1. Check all containers for leakage or breakage.  
2. Remove the frozen cells from the dry ice packaging and immediately place the cells at a temperature below -130°C, preferably in liquid nitrogen vapor, until ready for use.

### Handling Procedure for Frozen Cells

To insure the highest level of viability, thaw the vial and initiate the culture as soon as possible upon receipt. If upon arrival, continued storage of the frozen culture is necessary, it should be stored in liquid nitrogen vapor phase and not at -70°C. Storage at -70°C will result in loss of viability.

1. Thaw the vial by gentle agitation in a 37°C water bath. To reduce the possibility of contamination, keep the O-ring and cap out of the water. Thawing should be rapid (approximately 2 minutes).  
2. Remove the vial from the water bath as soon as the contents are thawed, and decontaminate by dipping in or spraying with 70% ethanol. All of the operations from this point on should be carried out under strict aseptic conditions.  
3. Transfer the vial contents to a centrifuge tube containing 9.0 mL complete culture medium and spin at approximately 125 x g for 5 to 7 minutes.  
4. Resuspend cell pellet with the recommended complete medium (see the specific batch information for the culture recommended dilution ratio) and dispense into a 25 cm² culture flask. It is important to avoid excessive alkalinity of the medium during recovery of the cells. It is suggested that, prior to the addition of the vial contents, the culture vessel containing the complete growth medium be placed into the incubator for at least 15 minutes to allow the medium to reach its normal pH (7.0 to 7.6).  
5. Incubate the culture at 37°C in a suitable incubator. A 5% CO₂ in air atmosphere is recommended if using the medium described on this product sheet.

### Handling Procedure for Flask Cultures

The flask was seeded with cells (see specific batch information) grown and completely filled with medium at ATCC to prevent loss of cells during shipping.

1. Upon receipt visually examine the culture for macroscopic evidence of any microbial contamination. Using an inverted microscope (preferably equipped with phase-contrast optics), carefully check for any evidence of microbial contamination. Also check to determine if the majority of cells are still...
If the cells are still attached, aseptically remove all but 5 to 10 mL of the shipping medium. The shipping medium can be saved for reuse. Incubate the cells at 37°C in a 5% CO₂ in air atmosphere until they are ready to be subcultured.

3. If the cells are not attached, aseptically remove the entire contents of the flask and centrifuge at 125 x g for 5 to 10 minutes. Remove shipping medium and save. Resuspend the pelleted cells in 10 mL of this medium and add to 25 cm² flask. Incubate at 37°C in a 5% CO₂ in air atmosphere until cells are ready to be subcultured.

### Subculturing Procedure

Volumes are given for a 75 cm² flask. Increase or decrease the amount of dissociation medium needed proportionally for culture vessels of other sizes.

1. Remove and discard culture medium.
2. Briefly rinse the cell layer with 0.25% (w/v) Trypsin-0.53 mM EDTA solution to remove all traces of serum that contains trypsin inhibitor.
3. Add 2.0 to 3.0 mL of Trypsin-EDTA solution to flask and observe cells under an inverted microscope until cell layer is dispersed (usually within 5 to 15 minutes).
   Note: To avoid clumping do not agitate the cells by hitting or shaking the flask while waiting for the cells to detach. Cells that are difficult to detach may be placed at 37°C to facilitate dispersal.
4. Add 6.0 to 8.0 mL of complete growth medium and aspirate cells by gently pipetting.
5. To remove trypsin-EDTA solution, transfer cell suspension to centrifuge tube and spin at approximately 125 x g for 5 to 10 minutes. Discard supernatant and resuspend cells in fresh growth medium. Add appropriate aliquots of cell suspension to new culture vessels. An inoculum of 4 to 6 x 10^3 viable cell/cm² is recommended.
6. Incubate cultures at 37°C.

**Subcultivation Ratio**: A subcultivation ratio of 1:2 to 1:4 is recommended every 10 to 15 days

**Medium Renewal**: Every 3 to 4 days.

### Cryopreservation Medium

Complete growth medium described above supplemented with an extra 50% FBS and 10% DMSO. Cell culture tested DMSO is available as ATCC Catalog No. 4-X.

### Comments

When using a non-humidified incubator, gassing of cultures with 5% CO₂ and plug-seal caps should be used to prevent evaporation of liquid in media and unintentional concentrating of media additives. Although FHC cells exhibit epithelial morphology, cytoplasmic keratins were not detected.

References and other information relating to this product are available online at [www.atcc.org](http://www.atcc.org).

### Biosafety Level: 1

Appropriate safety procedures should always be used with this material. Laboratory safety is discussed in the current publication of the *Biosafety in Microbiological and Biomedical Laboratories* from the U.S. Department of Health and Human Services Centers for Disease Control and Prevention and National Institutes for Health.

### ATCC Warranty

ATCC® products are warranted for 30 days from the date of shipment, and this warranty is valid only if the product is stored and handled according to the information included on this product information sheet. If the ATCC® product is a living cell or microorganism, ATCC lists the media formulation that has been found to be effective for this product. While other, unspecified media may also produce satisfactory results, a change in media or the absence of an additive from the ATCC recommended media may affect recovery, growth and/or function of this product. If an alternative medium formulation is used, the ATCC warranty for viability is no longer valid.

### Disclaimers

The base medium for this cell line is DMEM:F12 Medium (ATCC 30-2006). To make the complete growth medium, add the following components to the base medium:
- extra 10 mM HEPES (for a final conc. of 25 mM)
- 10 ng/ml cholera toxin
- 0.005 mg/ml insulin
- 0.005 mg/ml transferrin
- 100 ng/ml hydrocortisone
- 20 ng/ml human recombinant EGF (Thermo Fisher PHG0311)
- Fetal Bovine Serum, 10% final conc (ATCC 30-2020)

If use of this culture results in a scientific publication, it should be cited in that manuscript in the following manner: FHC (ATCC® CRL-1831™)
